

The Challenge

Paper printed patient waveforms/strips and interpretations can be difficult to access without physically holding the patient's chart.

- Patient waveforms and clinician interpretations are only available on the paper on which they are recorded.
- Review and collaboration is limited to those on the unit at any give time.
- Paper strips may become lost or associated to the wrong patient.
- Strips may not get scanned to the EMR until after the patient is discharged.

The Solution

Use ICS electronic printing to access patient waveforms/strips and interpretations where and when you need them.

- Patient waveforms are readily available for collaboration and care planning as soon as they are sent to the EMR
- Care team members can better access the data regardless of their location
- Complete the documentation process more quickly, precisely, and professionally

Spacelabs ICS software helps to streamline and expedite processes surrounding ECG strip and waveform documentation. It supports a reduction in manual activities, minimizes errors, and helps to prevent the loss of valuable patient data.

**Less paper. Less ink.
Less time. Less space.**
